

// Technical Proposal + Pricing

SavvySox Hologram Video Pipeline

PHASE 1 AI Video Generation + Auto-Delivery + Social Publishing Infrastructure

Prepared For	Date	Document Type	Status
Elbert Irving	14 July 2026	Technical Proposal + Pricing	Ready for Review

- 01 - Overview

What This Proposal Covers

The 13 hologram videos are approved. All of them. SavvySox has 37 designs sitting unproduced and a team posting to three platforms every day.

Right now every video requires a manual cycle: commission, wait, review, revise, download, then post manually. That cycle does not compress. It just repeats for every new design, every new collection, indefinitely.

This pipeline removes it entirely. Drop a sock image into a shared folder. Ten minutes later, the finished 15-second hologram video is in your delivery folder and every team member receives an email with a direct link. No commissions. No waiting. No back and forth.

- 02 - The Pipeline

How the Pipeline Works — End to End

- 01

Image Drop

Any team member places a new sock image (PNG or JPG) into the designated Google Drive input folder. That single action is the only human step in the entire production process. Nothing else is required.

Google Drive
- 02

Pipeline Trigger

n8n detects the new file in real time via the Google Drive trigger. It extracts the filename, which becomes the video name, downloads the image, and passes it to the generation layer. The workflow starts within seconds of the upload.

n8nGoogle Drive API
- 03

Scene Generation

Two video clips are generated per sock design. Scene 1 shows the sock rotating in 3D against a black background with holographic neon elements floating around it. Scene 2 is a tighter beauty shot with additional glow. Both clips run from the locked Kie AI prompt that produced your approved 13 videos. Same parameters every time.

Kie AIVeo 3 Fast
- 04

Final Assembly

Creatomate takes the two generated clips and assembles them into a single 15-second finished video. Your logo overlays in a fixed position. Background music layers in at a consistent level. The template enforces identical framing, timing, and resolution (650×1557 at 30fps) on every single render. There is no variation.

CreatomateLogo LayerAudio Layer
- 05

Delivery

The finished video uploads to your Google Drive delivery folder, named exactly after the input sock image file. The source image moves to a Processed archive automatically, preventing duplicate runs and giving your team a full audit trail of every design produced.

Google Driven8n
- 06

Team Notification

An email fires to your full team the moment each video lands in the delivery folder. The message includes the sock name and a direct link to the file. No one needs to check the folder manually. The pipeline tells them when it is ready.

Gmail
- 07

Social Publishing Layer

TikTok, Instagram Reels, and Facebook Reels publishing nodes are wired into the pipeline and built to spec in Phase 1. They sit inactive by default. When you are ready to go live on any platform, activation requires one confirmation from you. No additional build work.

What Keeps Every Video On-Brand

When you are generating 50+ videos from a pipeline, the real question is whether the 50th looks as good as the 1st.

- ✓

Locked generation prompt. The exact Kie AI prompt that produced your approved 13 videos is hardcoded into the workflow. It does not change, does not drift, and is not editable by accident. Every generation uses identical parameters on every run.
- **Creatomate template enforces structure.** Logo position, music timing, video resolution, scene order — set once in the template and applied identically to every render. There are no per-video settings to misconfigure.
- ⚠

Failed generation detection. If Kie AI returns an error or a blank output, n8n checks the response before passing it to Creatomate. The workflow stops, flags the file, and sends a separate alert email to the team. A failed video never reaches your delivery folder.
- 🔗

Processed archive prevents duplicate runs. After successful delivery, the source image moves to a Processed subfolder automatically. The input folder never triggers the same file twice, and your team has a clean audit trail of every design produced to date.

- 03 - Scope

What I'll Build

Phase 1 — Complete Scope

Everything below is built, tested, and delivered in Phase 1. Nothing is a future upgrade or add-on.

Component	What It Does	Status
n8n Automation Workflow	Full pipeline orchestration from Drive trigger to team notification	Phase 1
Google Drive Setup	Input folder, Delivery folder, Processed archive	Phase 1
Kie AI Integration	2-scene video generation per sock design using Veo 3 Fast	Phase 1
Creatomate Assembly Template	Logo overlay, music layer, 650×1557 render at 30fps	Phase 1
Gmail Team Notifications	Email alert to full team with sock name and direct Drive link	Phase 1
37-Video Launch Batch	All remaining designs processed and delivered on go-live day	Phase 1
TikTok / IG / Facebook Nodes	Publishing infrastructure built and inactive, one step to activate	Phase 1

Channels in Scope

Channel	Content Type	Status
TikTok	15-sec hologram product video	Built — inactive
Instagram Reels	15-sec hologram product video	Built — inactive
Facebook Reels	15-sec hologram product video	Built — inactive

Intentionally Deferred

Feature	Reason
Auto-posting activation	Client-controlled. One confirmation activates any platform. No additional build work required.
Caption and hashtag generation	Copywriting for social posts is out of scope for Phase 1.
Social-format resize (1080x1920)	Phase 1 delivers hologram display spec (650×1557). Social format is available as a Phase 2 add-on.
Analytics and performance tracking	Platform-level reporting is out of scope for Phase 1.

The auto-posting infrastructure is fully built in Phase 1. Activation is a single-step toggle. No additional development is needed when you are ready to go live on any platform.

- 04 - Timeline

Milestone Breakdown

- WEEK 1

Build and Integration
 - Set up Google Drive folder structure: Input, Delivery, Processed
 - Build n8n workflow with Google Drive trigger and file handling logic
 - Integrate Kie AI API with 2-scene generation per sock design
 - End-to-end test with 5 sample sock designs to verify output quality and style match

Checkpoint — First 5 automated videos pass visual review and match the approved 13-video style exactly
- WEEK 2

Assembly Layer and Notifications
 - Build Creatomate assembly template: logo overlay, music layer, 650×1557 at 30fps
 - Wire Creatomate render step into n8n workflow with error detection
 - Configure Gmail team notifications with dynamic sock name and Drive link
 - Build TikTok, Instagram, and Facebook publishing nodes (inactive)

Checkpoint — Full pipeline run confirmed: image drop in Drive triggers complete automation, video delivered, team notified
- WEEK 3

37-Video Launch Batch
 - Process all 37 remaining sock designs through the live pipeline
 - Quality check every 10 videos and flag any requiring re-generation
 - Deliver all 37 finished videos to the Sock Videos Drive folder

Checkpoint — All 37 designs delivered and accessible in the delivery folder, reviewed and approved
- WEEK 4

Handoff and Documentation
 - Provide written guide: how to add new designs, what to do if a video needs re-generation
 - Team walkthrough confirming the input folder process works for all members
 - Final go-live confirmation and sign-off

Checkpoint — Elbert or a team member successfully triggers and receives a new video independently without assistance

- 05 - Ongoing Costs

Ongoing Platform Costs

After delivery, the pipeline runs on three tools. Kie AI: \$50 credit bundle (10,000 credits, covers approximately 62 videos per month, unused credits carry forward and never expire). Creatomate Essential handles assembly and rendering at \$41–54 per month. n8n Cloud Starter manages all workflow orchestration at \$24 per month. Google Drive and Gmail have no additional cost. Total running cost at full volume is approximately \$115–128 per month.

Service	Monthly Estimate
Kie AI — \$50 credit bundle, 10,000 credits, ~62 videos (credits never expire)	\$50 / month
Creatomate Essential — assembly, rendering, logo, music	\$41-54 / month
n8n Cloud Starter — workflow orchestration, Google sign-in, auto-managed	\$24 / month
Google Drive + Gmail	Free
Total running cost at full volume	~\$115-128 / month

- 06 - Investment

Investment

Pipeline build + Kie AI + Creatomate template + Drive delivery + team notifications + 37-video launch batch	\$1,200	Core Pipeline — \$1,200
Everything in Core plus TikTok, Instagram, Facebook publishing nodes built and ready to activate on demand	\$1,500	Full Stack (Recommended) — \$1,500

The Full Stack option is \$300 more than Core and delivers the complete system. Publishing nodes are built into the same Phase 1 workflow. When you are ready to auto-post to any platform, there is nothing else to commission. One confirmation and it goes live.

Payment Terms

50% before build begins. 50% on delivery of all 37 videos and system handoff. No payment is due for work not delivered.

- 07 - Next Step

What I Need From You

- Logo file — PNG with transparent background, 1000px or larger preferred
- Background music — send one MP3 track, or describe the genre and mood and we will source it
- Team email addresses — all members who should receive video delivery notifications
- Google Drive access — share your existing workspace or we will create a shared folder and send you an invite
- Video format confirmation — 650×1557 hologram display spec only, or also 1080×1920 social format for TikTok, Instagram, and Facebook
